

SQL

CASE Statement in SQL

Pradeep M
@pradeep-m-analyst

The CASE statement in SQL is used to add **conditional logic** to SQL queries.

It evaluates conditions and returns results based on which condition is **true**.

For example, let's consider a simple table
named **Students**:

StudentID	Name	Grade
1	Pankaj	85
2	Karthika	90
3	Ramesh	78
4	Priyank	92

Now, let's use a **CASE** statement to categorize students based on their grades:

```
SELECT Name, Grade,  
CASE  
    WHEN Grade >= 90 THEN 'A'  
    WHEN Grade >= 80 THEN 'B'  
    ELSE 'C'  
END AS GradeLetter  
FROM Students;
```

OUTPUT

Name	Grade	GradeLetter
Pankaj	85	B
Karthika	90	A
Ramesh	78	C
Priyank	92	A

In this example, the **CASE** statement checks the **Grade** for each record in the **Students** table.

- If the grade is **90 or above**, it returns **'A'**.
- If the grade is **80 or above** but less than 90, it returns **'B'**.
- If the grade is **less than 80**, it returns **'C'**.
