

SQL

Stored Procedure vs Views vs UDF

Pradeep M
@pradeep-m-analyst

1

Stored Procedures

A stored procedure is a **set of SQL statements** that you can save and reuse.

It's like a function in programming that can take inputs (parameters), perform tasks, and return results.

2

Views

A view is a **virtual table** based on a SELECT query.

It doesn't store data itself but displays data from one or more tables as if it were a single table.

3

User-Defined Functions

A UDF is a function that **you can define yourself.**

It can take inputs, perform a calculation or operation, and return a single value (scalar UDF) or a table (table-valued UDF).

In Summary

- Use **stored procedures** for complex operations and business logic.
- Use **views** to simplify and secure data access.
- Use **UDFs** for reusable calculations and operations within queries.

5

**Please refer to the description above where
you'll find links to more detailed information
on each of these topics**

**I hope you find this
valuable! 🥰**

**A like from you would be a great
encouragement**
